

Past and Current Projects

Here are some examples of projects for other clients:

Researched and recommended a backup solution for a non-profit, and then installed and configured the system. I currently monitor the device and exchange hard drives in the system to maintain one off-site backup of data, one on-site backup drive, and the device itself containing 2 hard drives in mirrored RAID.

Installed a Wifi Mesh in a medium-sized, 2-story building. Configured the system with both staff and guest wifi networks. This install included infrastructure wiring changes.

Removed an old sound snake and installed a new one. Set the house sound system up, and trained personnel to use the system.

Evaluated and made recommendations for all computers in a business then recommended new purchases. Installed, setup, and configured new computers, and also upgraded ones that did not need replacing. These upgrades included both hardware and software (including operating systems).

Configured a Windows Server 2012 R2 machine for network scanning and file sharing. Set up the scan paths from a Canon printer/copier/scanner to the file server.

Evaluated, recommended, and implemented anti-virus solutions for multiple machines for several clients.

Set non profit organization up with vendors who offer free and discounted hardware, software, and other goods/services to NPO's.

Set up Microsoft 365 services for NPO's, including migration of email accounts from both in-house Exchange servers and POP3/IMAP servers. Maintain and support Microsoft 365 services and offer training to staff and volunteers on these services.

Train and evaluate staff and volunteers for Audio/Video and I.T. ministries within churches. Also evaluate equipment for all of these ministries and make recommendations based on both need and organization's budget.
